Due Jul 19, 11:59 PM

This week you'll build a simple banking app. We're providing you the HTML template. You just need to make it functional with PHP.

The features are simple.

There are two types of users: **'Admin'** and **'Customer'**.

Admin Features

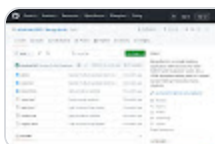

- See all transactions made by all users.
- Search and view transactions by a specific user using their email.
- View a list of all registered customers.

Customer Features

- Customers can register using their name, email, and password.
- Customers can log in using their registered email and password.
- See a list of all of their transactions.
- Deposit money to their account.
- Withdraw money from their account.
- Transfer money to another customer's account by specifying their email address.
- See the current balance of their account.

Note:

- Use OOP concepts.
- Use 'File' for storage.
- You'll need to use 'Session' for the Logged in users functionality.
- You must use 'Composer' to autoload your files. Also, make sure to use Namespaces.
- You must share your Github repo link for this submission.
