Due Jun 29, 11:59 PM

Build a simple CLI application for **adding income, adding expenses, viewing income/expense list, viewing income/expense categories, and viewing savings(total income - total expense).**

There should be a **Category** for each income and expense.

For example, when the script runs, the user should see a list of options like the following:

1. Add income
2. Add expense
3. View incomes
4. View expenses
5. View savings
6. View categories

Enter your option:

Users can write the option number and press `Enter`. Based on the given option, they might need to add more info or see the result.

Try to use **OOP** concepts if possible. But if you find it hard to use OOP, you can do it in a Procedural way as well.

Make sure to store the data in files so that the data persists after the script ends and the script can use the stored data next time.
